Cancer cells are cells that divide relentlessly, forming solid tumors or flooding the blood with abnormal cells. Cell division is a normal process used by the body for growth and repair. A parent cell divides to form two daughter cells, and these daughter cells are used to build new tissue, or to replace cells that have died because of aging or damage.

Cancer is not just one disease. There are many types of cancer. But all cancers start when a group of cells in the body grows out of control. Cancer cells keep on growing and can crowd out normal cells. This makes it hard for the body to work the way it should. Cancer can start any place in the body ...

If You Have Small Cell Lung Cancer - American Cancer Society

Nobel prize winner Otto Warburg discovered cancer cells only thrive in a low pH highly acidic cell environment. As revealed in the 6 Phases of Cancer, normal cells become highly acidic due to prolonged chronic psycho-emotional stress depleting adrenaline reserves, breaking the cell's Krebs' Citric Acid Cycle. This causes the cell to ferment glucose as an alternative means of obtaining smaller ...

The terms 'Mitosis' and 'Cell Cycle' are not synonymous. The somatic cell cycle is the name given to the series of events that occur as one cell divides into two cells that are genetically identical both to each other and to the parent cell, which then grow to full size. Even rapidly dividing cells spend only a small percentage of their existence dividing.
