photosynthesis! And the Sun is the ultimate source of the light. If I do a repeat performance, I insist that the class shouts out what's in the bucket before I get excited (water), what's in it afterwards (oxygen), and what I tossed out into the class (energized H). This is especially effective just before lunch, or at the end of the day!

Figure. The mechanism of photosynthesis is complex and requires the interplay of many proteins and small molecules. Photosynthesis in green plants takes place in chloroplasts ( Figure 19.1 ). The energy of light captured by pigment molecules, called chlorophylls, in chloroplasts is used to generate high-energy electrons with great reducing potential.

Photosynthesis is a process in which sunlight energy is used to make glucose. The site of photosynthesis is in the chloroplast – an organelle found in the leaves of green plants. The main functions of chloroplasts are to produce food (glucose) during photosynthesis, and to store food energy. Chloroplasts contain the pigment, chlorophyll.
