Which observation cannot be explained by a geocentric model? Stars follow circular paths around Polaris. The Sun's path through the sky is an arc. A planet's apparent diameter varies. A freely swinging pendulum appears to change direction.

### **Which observation... ? | Yahoo Answers**

History of observation. In the 1670s the British astronomer John Flamsteed and the French astronomer Gian Domenico Cassini calculated the distance to the Sun. Sir Isaac Newton set forth the role of the Sun as the centre of attraction of the known planetary system.

### **Sun - History of observation | Britannica.com**

Questions 32 through 34 refer to the following: The diagrams below represent plastic hemisphere models. Lines have been drawn to show the apparent path of the Sun across the sky on June 21 for observers at four different Earth locations. The zenith ( Z ) is the point in the sky directly over the observer.

### **D - Earth science**

The path of the Sun across the celestial sphere is very close to that of the planets and the moon. After clocks became available, it was a relatively straightforward job for astronomers to relate the path of the Sun in the daytime to the one of stars at night, and to draw it on their star charts.

### **The Path of the Sun, the Ecliptic - NASA**

According to an online Sun position calculator, the observed total motion from first observation to last observation was only off by  $1.5^\circ$  compared to accepted values.[8] Using Excel to plot a linear curve fit, an  $R^2$  value of 0.9987 was obtained. This seems to indicate the rate of change in azimuth is linear.

### **Sunset Observation Project - Eric Withrow**

The diagram represents the Sun's apparent paths as viewed by an observer located at 50° N latitude on June 21 and March 21. The data table shows the Sun's maximum altitude for the same two dates of the year. The Sun's maximum altitude for December 21 has been left blank.

**1. Which event is a direct result of Earth's revolution? C ...**

35) Which observation about the Sun's apparent path at this location on June 21 is best supported by the diagram? A) Sunset occurs south of west. B) The Sun appears to move across the sky, at a rate of 10D per hour. C) Sunrise occurs north of east. D) The Sun's total daytime path is shortest on this date.
