The Movement Of Ocean Water

Go with the flow: Indian Ocean. Our 15 year simulation indicates that water from the Pacific Ocean enters the Indonesian Archipelago through the Mindanao current (north) and Halmahera Sea (south).

A current affair: the movement of ocean waters around ...

An ocean current is a continuous, directed movement of sea water generated by a number of forces acting upon the water, including wind, the Coriolis effect, breaking waves, cabbeling, and temperature and salinity differences. Depth contours, shoreline configurations, and interactions with other currents influence a current's direction and strength. Ocean currents are primarily horizontal water ...

In physics, the Coriolis force is an inertial or fictitious force that seems to act on objects that are in motion within a frame of reference that rotates with respect to an inertial frame. In a reference frame with clockwise rotation, the force acts to the left of the motion of the object. In one with anticlockwise (or counterclockwise) rotation, the force acts to the right.

Ocean: Ocean, continuous body of salt water held in enormous basins on Earth's surface. There is one 'world ocean,' but researchers often consider it five: the Pacific, Atlantic, Indian, Arctic, and Southern oceans. Covering nearly 71 percent of Earth's surface, the oceans have an average depth of 3,688 metres (12,100 feet).

Learn about the ocean in motion and how ocean surface currents play a role in navigation, global pollution, and Earth's climate. Also discover how observations of these currents are crucial in making climate predictions.

Ocean Motion and Surface Currents

Ocean currents are the vertical or horizontal movement of both surface and deep water throughout the world's oceans. Currents normally move in a specific direction and aid significantly in the circulation of the Earth's moisture, the resultant weather, and water pollution.

An Overview of Ocean Currents and How They Circulate

Water is cooler near the poles and warmer near the equator Movement of cooler and warmer water from these regions moderates the global climate what describes the movement of water?

In many areas of the ocean floor, wherever magma nears the seafloor, or where lava erupts directly at the seafloor surface, hot springs on the seafloor called hydrothermal vents commonly are found. Vent fields are generally associated with submarine (undersea) volcanoes where lava is erupting or preparing to erupt.
