The solution to a system of distinct, non-disjoint linear inequalities is the intersection of two half-planes, which contain infinitely many points. 3x 5y 8, 6x y 1.7 e. Examples. 3x 22 8x 7 or 3x 4y 12 Solving this inequality is similar to solving 5x5 7 42. The operations (, , ,) are applied to both sides.

where m and b are constants. A typical use for linear functions is converting from one quantity or set of units to another. Graphs of these functions are straight lines. m is the slope and b is the y intercept. If m is positive then the line rises to the right and if m is negative then the line falls to the right.

A major application of linear algebra is to solving systems of linear equations. This lecture presents three ways of thinking about these systems. The "row method" focuses on the individual equations, the "column method" focuses on combining the columns, and the "matrix method" is an even more compact and powerful way of describing systems of linear equations.

Shape Algebra blows away the traditional opening line of an algebra lesson, viz: "Let x stand for any number". In this task x is a shape! Well actually it is the number that stands for the area of the shape, but the exciting feature of the task is that the algebra becomes geometry.

Linear transformations and matrices. Vector spaces are one of the two main ingredients of linear algebra, the other being linear transformations (or "operators" in the parlance of physicists). Linear transformations are functions that send, or "map," one vector to another vector.
